Recap 2024-04-29

• Fixed Linear Effect Models

• Interactions

• Simulation : (1) Given a true model, i.e. known true values for intercept and slope in a regression of BW on BC.

(2) Generate data based on known model

(3) Analyse generated data

(4) Compare results from analysis to true values used in data simulation.

→ Minimum number of observations required depending on how "close" results should be to true values.

• Idea of repeated observations
